Dear Angela

RE: Current Stormwater Management Strategy

This letter is prepared to confirm that the current Stormwater Management Strategy completed in 2016 by Stormy Water Solutions is still valid for consideration by authorities.

The stormwater treatment modelling methodologies and parameters used since the writing of the report don't have any changes that would impact on sizing of wetlands and other WSUD assets. Therefore, the results contained within the report would still be valid.

The hydrology component of the report has been prepared using the Australian Rainfall and Runoff methodology prior to the 2016 update. Although the updated industry standard was a major change in the methods employed for flow estimation, the magnitude of the peak flow events should not vary greatly. Any variances in flow rates using the new method will impact on sizing of the retarding basins and outlet sizing, which are only expected to be considered during later stages of the functional and detailed designs.

The overall arrangement of stormwater management and treatment assets, reserves, and overland flow paths would not be changed as a result of industry changes in flow estimation. They will be considered in functional and detailed design stages of the development to ensure that they are consistent with current industry practice.

Yours sincerely,

Aram Manjikian
